

NIGHTSHIFT

The company with no one to ask.

An agent-run company whose approvals are answered by written policy. When the policy runs out, it buys a human and expenses it.

Surya · Anirudh · Pravin

THE WALL

Every agent loop stops in the same place.

It reaches something it can't undo: send the email, ship the deploy, charge the card. Then it waits for a human to type yes.

```
$ update_task.py --question "List on Whop?"  
status: waiting_owner
```

Five blocks, five names for the same gate. It isn't a bug. It's the safety floor. **And a company with no owner can't answer it.**

THE SWAP

We didn't remove the gate.
We changed who stands behind it.

An approver agent answers at the exact same interface a human used: same field, same file. It may only answer by citing a written clause.

- 10 clauses, 50 lines, in git
- Silence is never consent, so it escalates
- Every decision appends to a ledger

```
$ git log --oneline -- update_task.py  
104f7d6 Add first block: taskrunner
```

One commit. Ever. The gate we're talking about has **never been modified**. Not one line, by us, all day. Check it yourself.

WHEN POLICY CAN'T DECIDE

The company hires a human.
And expenses it.

ESCALATED

"May Nightshift list the Policy Gate Kit on Whop's marketplace, under terms that take a revenue share on each sale?"

agent · 12:15 · P9

APPROVE

"The current written policies are silent on this type of external distribution... a standard revenue-share arrangement provides a reasonable and commercially established framework."

hired human · terac · \$13.50

No clause covered a distribution agreement with a third party, and P9 forbids stretching one by analogy. So the company posted the question to Terac, a verified human answered it in their own words, and the payment released on completion.

No employees. No owner in the loop.
When it needs a human, it buys one.

THE RUN

Nobody touched a keyboard
except to start it.

- An agent answered the founding interview and wrote the company brain
- The goal agent chose the product, wrote the copy, set the price at \$19
- Every gate was answered by policy, or escalated when no clause fit
- Listed, priced, and on sale, with the decisions on the record

DECISIONS ON THE LEDGER

0

ANSWERED BY AN OWNER

2

ESCALATED, NO CLAUSE FIT

1

BOUGHT FROM A HUMAN

\$13.50

WHAT THAT JUDGMENT COST

THE PROOF

Real money. Real limits.

\$ [N]

REVENUE, OUR OWN STRIPE

[N]

BUYERS

[N]

STRANGERS, NOT IN THIS ROOM

We tried to buy aggregate judgment too: a general-population study on the policy itself. The approver approved the spend, citing P2 and P3 with the day's running total in its reasoning.

Terac quoted	n=10	\$150.00
	n=7	\$115.50
	n=5	\$82.50
	n=5 @ 1 min	\$67.50
policy ceiling, single spend		\$15.00
		every rung refused. \$0 moved.

It wanted the data and could not afford it under its own rules, so it went without. The refusal is on the ledger, and it is the better exhibit: the spending gates bind the company's own appetite, not just ours.

NIGHTSHIFT

The gates
never came down.

We changed who stands behind them.
